

# TransektCount

## 1. Introduction

TransektCount is an Android App that supports transect counters in nature preserving projects according to the Butterfly Monitoring Scheme methodology (Fig. 1). It allows a species-specific counting per transect section. It can substitute your field book and pencil, and with a modern smartphone you carry a camera for pictures of interesting species anyway.

The integrated database is organized according to a transect inspection. That means, there will be used a new database instance per inspection.

Databases can be individually created and adapted regarding transect sections and expected butterfly species.

The recorded data (counts and remarks) may either be read on the smartphone or transferred to a PC for your own processing.

The app has no tracking or advertising functions and demands only for storage access permits which are needed for im-/exporting the counting data.

Fig. 1: Starting page

## 2. Set up

Before initial use you must set up an empty basic database (Basic DB). Therefore, you first create a species list for the first transection section. Use the function "New Section" from the "List of Transect Sections" menu for that (Fig. 2).

Then (Fig. 3) this list gets a name (e.g.: Sect 01) and subsequently an entry for each expected species (Add Species), e.g.:

```
Sect 01
-----
P. napi
P. rapae
P. na./ra.-compl.
...
```

You may add one or two spare entries for unforeseen cases at the end. This list can be changed or supplemented afterwards. With "Save List" you get it stored into the database.

Fig. 2: Create new section list

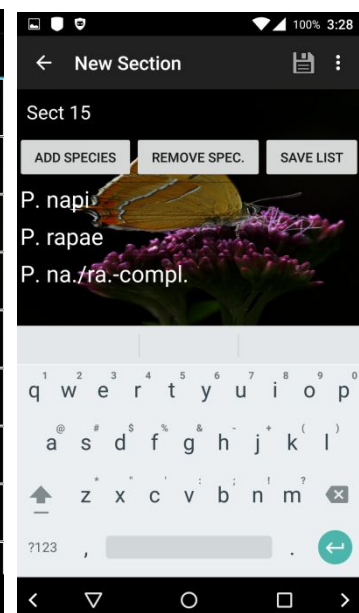

Fig. 3: Edit new section list

Once this list is complete, you can copy it for all remaining transect sections (section counting page menu: "Duplicate Section List") and name each accordingly (e.g.: Sect 02, Sect 03,...).

When you have created the section lists for all transect sections, the database is ready for export as the "Basic Database". Therefore you find the function "Export as Basic DB" in the menu of the starting page. After that you have a copy of the empty database saved as "Basic Database" (transektcount0.db) within the home directory /sdcard (or /sdcard0, or /storage/emulated/0, it differs between smartphone models).

The "Basic Database" will be used as a template for all further transect inspections in future. For safety reasons you should copy the Basic Database file "transektcount0.db" to a different backup directory by a file manager.

### 3. Usage

Start with the “List of Transect Sections” (Fig. 4). Here you see the table with all your transect sections.

Select the relevant transect section. The counting page appears (Fig. 5).

As it ought to be distinguished between counts of butterflies within the imaginary count area and butterflies outside you have 2 separate counters (“i” for internal and “e” for external).

To count just tap on either the internal or external “+”-Button of the corresponding species. The “-”-Buttons allows for corrections.

While storing the counting results of a section the current date and time of the inspection will be stored either. The date and a possible section remark will then be shown in the list of sections.

The Pencil-Button in the app bar of the counting page opens the section editing page (Fig. 6) for adding remarks for the section and editing the names of section and species. The section related remarks will be shown at the end of the species list and within the section list.

The Pencil-Button in each species row of the counting page opens the species editing page (Fig. 7) that lets you add remarks for each species and set its counters to any value. Here you may also set pop-up alarms which show up while reaching a set value on the corresponding internal counter (e.g. to realize already on site if a certain species is more abundant than on a previous inspection).

If you enter a species related remark this will be shown on the counting page in an extra line beneath the row.

To move back one page you can use the arrow in the left upper corner.

Nearly each app page has its specific context menu. You can activate it with the 3-point-symbol in the upper right corner.

When you have large lists or have collect big amounts of data the app may slow down a bit, especially when entering a transect section list. But with newer smartphone models it should be irrelevant.

Finally, there is a page showing your results (Fig. 8). Here you see only the species which got counts. You open this page from the Starting page with the “Show Result”-Button or the Eye-symbol in the app-bar. It may take a few seconds to show up.

## 4. Further functions

The "Settings" menu (Fig. 9) can be reached from each page of the app. Here you may adapt the look and feel in some aspects to your wishes, e.g. sounds and alerts.

Selecting an own background picture can be achieved by the Gallery App, accessible in the left side menu of the background option (if applicable wipe from the left edge)..

The menu on the starting page (Fig. 10) has Import, Export, Help, Info and Settings functions.

Here you may export the DB as "Basic DB" (only reasonable, as long as all counters are zero, see "2. Settings").

Here you may export a copy of the current database (Export DB) which contains only

actual counts to /sdcard/transektcount\_YYYY-MM-DD\_hhmmss.db.

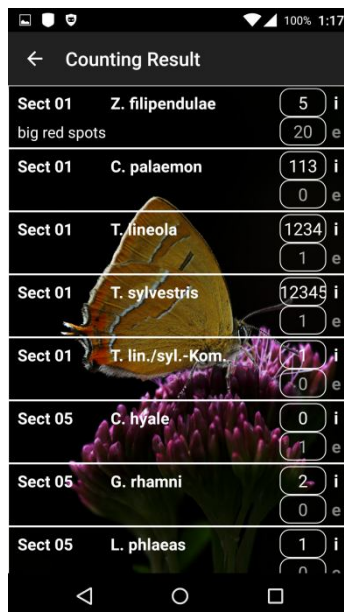

Here you may import the Basic DB from /sdcard/transektcount0.db as a base for a new transect inspection. But notice: Importing a Basic DB clears all existing counting information.

And you may find here under "App Info" the email address of the author (for bug reports), the history of the app and the license note.

The menu of the "List of Transect Sections" allows you to create new section lists. This function will be used only while creating the Basic DB or for changes in a transect.

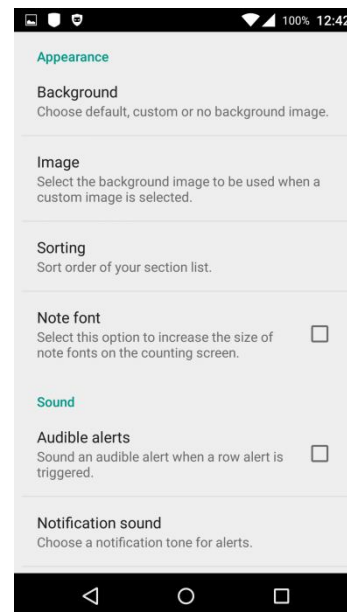

The counting page of a selected section list provides the "Duplicate Section List" function. This function is used while creating a Basic DB, as described under "2. Set up". The menu of this page provides a "Share" function for sending notes using a standard app, like SMS or email.

IT-affine users may transfer the exported "transektcount\_YYYY-MM-DD\_hhmmss.db" or ".csv" files to a PC. With the free tool "SqliteBrowser" (sqlitebrowser.org) you may examine the db-file. The .csv file may be imported to an Excel sheet for further processing.

Sect	Species	Count	Unit
Sect 01	Z. filipendulae	5	i
	big red spots	20	e
Sect 01	C. palaemon	113	i
		0	e
Sect 01	T. lineola	1234	i
		1	e
Sect 01	T. sylvestris	1234	i
		1	e
Sect 01	T. lin./syl.-Kom.	0	i
		0	e
Sect 05	C. hyale	0	i
		1	e
Sect 05	G. rhamnii	2	i
		0	e
Sect 05	L. phlaeas	1	i
		0	e

Fig. 8: Counting Result

**Appearance**

**Background**  
Choose default, custom or no background image.

**Image**  
Select the background image to be used when a custom image is selected.

**Sorting**  
Sort order of your section list.

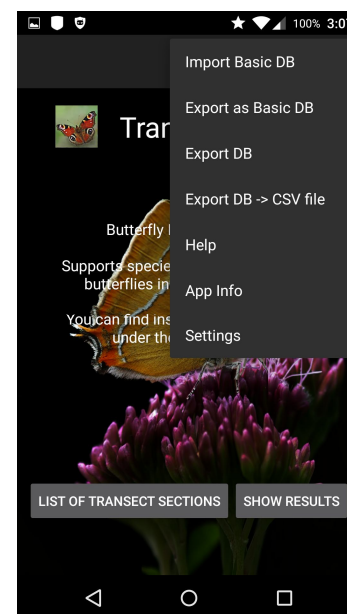

**Note font**  
Select this option to increase the size of note fonts on the counting screen. ☐

**Sound**

**Audible alerts**  
Sound an audible alert when a row alert is triggered. ☐

**Notification sound**  
Choose a notification tone for alerts.
